EDUCATION

Northeastern University – Boston, MA

May 2025

B.S. Computer Science, Minor in Graphic & Information Design

GPA: 3.9/4.0, Dean's List

TECHNICAL SKILLS

Languages: Java, Python, TypeScript, JavaScript, SQL, C

Frameworks/Libraries: Angular, React, React Native, PyTorch, NumPy, Pandas

Databases: MongoDB, MySQL

Tools/Platforms: Git, Linux, Docker, Jenkins (CI/CD), Kafka, Postman, Xcode, Android Studio, Palantir Foundry

Methodologies: Agile/Scrum, RESTful APIs, Microservices, Unit Testing, Code Reviews

WORK EXPERIENCE

AT&T – Software Engineer

Jul 2025 – Present

- Replaced client-side polling with a Kafka-based pipeline to support real-time updates in the Angular frontend, reducing API load and improving system scalability.
- Reworked a core Angular data table used by 35,000+ AT&T technicians, adding column resizing and improving performance for large datasets.
- Consolidated two Angular applications into a single codebase by merging shared modules and functionality, reducing duplication and improving maintainability.

MORSE Corp – Python Software Engineer Co-op

Jan 2024 – Jun 2024

- Built a Python dashboard using the Foundry API to monitor machine learning model performance, including accuracy metrics, enabling engineers to identify and troubleshoot underperforming models.
- Integrated data from computer vision systems, traditional sensors, and human-labeled data for machine learning and AI projects.

Skillz – SDK Co-op

Jan 2023 – Aug 2023

- Increased tutorial completion by 40%, Day-1 retention by 30%, and Day-0 paid conversions by 7% for a gaming platform with 3M MAUs by creating a new onboarding tutorial and username generator.
 - Developed a cross-platform league progression system used in 6M+ daily competitions, improving player engagement and long-term retention.
 - Resolved UI and authentication bugs in single-sign-on flows to ensure a reliable login experience for players across supported games.
-

PROJECTS

Personal Portfolio OS | TypeScript, React, Framer Motion, Python, FastAPI, OpenAI | [Live Demo](#) | [Github](#)

- Built a browser-based desktop OS UI from scratch with custom React hooks handling window z-index, drag/resize, focus, and viewport clamping.
- Implemented a 3-tier AI assistant (RAG/FAISS backend → direct OpenAI call → regex fallback), ensuring the assistant always works regardless of infrastructure.

HuskyFlow | TypeScript, React, Node.js, MongoDB, WebSockets | [Live Demo](#) | [Github](#)

- Developed a full-stack Q&A platform with RESTful APIs, community spaces, user following, and Google OAuth authentication.
- Implemented real-time polls with WebSockets so votes update live and polls expire without page refresh.

Text Simplification Application | Python, PyTorch, React, Flask | [Github](#)

- Fine-tuned a T5 transformer with a custom word-complexity approach, served via a React + Flask app accepting text or audio input with text-to-speech output.
